Introduction

SMH Technologies offers a new useful tool dedicated to FlashRunner 2.0 NXG to provide galvanic isolation between the programming system and the devices under test/programming (DUTs).

Relay Barrier versions

FlashRunner 2.0 NXG supports up to 4 channels so it allows to interface in parallel up to 4 independent and heterogeneous devices. The customers choose to enable the needed channels (1, 2, 3 or 4) according to their project requirements and, eventually, extends the programming system capabilities, in terms of numer of channels, through a simple software license update. Relay Barrier with Cable Interface is available in two different versions:

FlashRunner 2.0 NXG Relay Barrier 2-channels

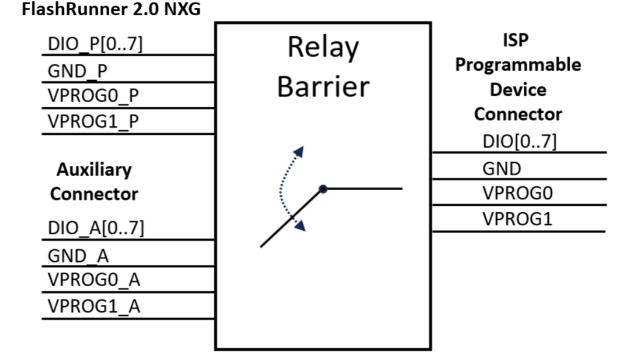

FlashRunner 2.0 NXG Relay Barrier 4-channels

SMH

Relay Barrier operation

Relay barrier gives the chance to separate the programmer lines and the ISP programmable devices when other operations such as In-Circuit Test procedures are carried out by the machinery. **Relay Barrier is normally open**, separating programmer's lines and ISP programmable devices but connecting Auxiliary Connector to ISP device connector. Relay command and power supply are provided directly through the FlashRunner 2.0 NXG ISP connectors.

With the command RLYCLOSE (please check FlashRunner 2.0 Programmer's Manual for more details) the specific channel is activated and the current can flow through the external relay coils closing the relay. The command RLYOPEN stops the current flow releasing the relays.

RLYOPEN command

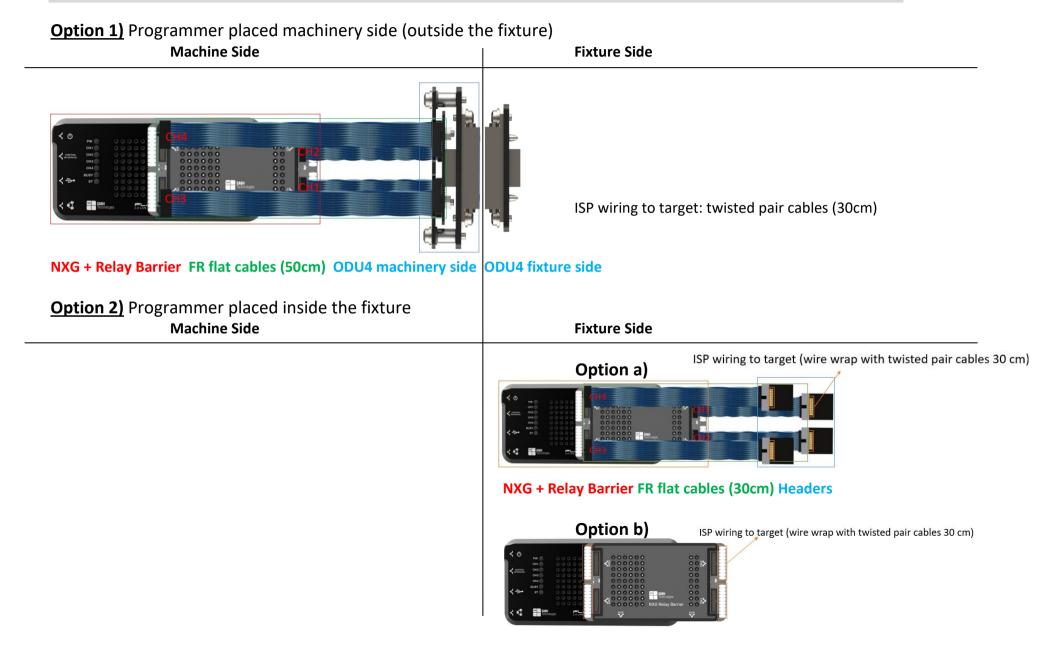

the relay switches go in the (normally) OPEN position the **ISP device connector lines of the barrier are connected to the auxiliary connector**

RLYCLOSE command

the relay switches go in the CLOSED position the ISP device connector lines are connected to the Active Module line

Integration guidelines

Machinery side:

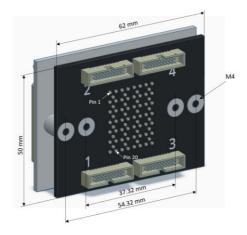

When the programmer is placed outside the fixture (**option 1**), it is highly recommended to employ the following suggestions to reach the fixture and maintain optimal signals integrity and stability:

FR cable

Description	Part Number	Length[cm]
Flat cables .025 Flat 30AWG	FRCABLE30	30
Flat cables .025 Flat 30AWG	FRCABLE50	50

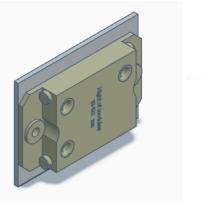

ODU 4 mass interconnection specifications machine side:

Description	Part Number
Pin frame ODU MAC-L - 8 units (machinery side)	JB-ODU4-FLAT20-MAC

HQ and Registered Office Via Giovanni Agnelli 1 33083 Villotta di Chions (PN) Italy Capitale sociale €102.040 P.I. 01697470936 C.F. 01697470936 REA PN-97255 D-U-N-S[®] 33-924-9717 T + 39 0434 421 111 F + 39 0434 639 021 UNIVERSAL PRODUCTION IN-SYSTEM PROGRAMMING

ODU 4 mass interconnection specifications fixture side:

Description	Part Number
Pin frame ODU MAC-L - 8 units (fixture side)	JB-ODU4-FLAT20-FIX

Another type of mass interconnections available at SMH for other products of the 2.0 line (FR2.0 8CHs, 16CHs) is **FR2.0: pylon block 8 CHs**

Description	Part number
Signal Receiver Pylon Block (machinery side)	JB-PYLON-FLAT20-MAC

Description	Part number
Interchangeable Test Adapter Pylon Block (fixture side)	JB-PYLON-FLAT20-FIX

HQ and Registered Office Via Giovanni Agnelli 1 33083 Villotta di Chions (PN) Italy Capitale sociale €102.040 P.I. 01697470936 C.F. 01697470936 REA PN-97255 **D-U-N-S**[®] 33-924-9717 **T** + 39 0434 421 111 **F** + 39 0434 639 021 UNIVERSAL PRODUCTION IN-SYSTEM PROGRAMMING

Fixture side

When the programmer is placed inside the fixture and the target is far from the programmer (**option 2a**), the best practice to reach it would be to use a flat cable (minimum length provided by SMH is 30cm, highly suggested for this application) from the new relay barrier cable interface connector to reach the cable interface header to then wire wrap the desired ISP signals.

FlashRunner2.0 NXG + new relay barrier

Flat cable

Cable interface header

When the programmer is placed inside the fixture and the target is closed to the programmer (**option 2b**), the new relay barrier allows the customer to directly wire-wrap the desired ISP signals.

In general

The ISP wiring to target in both cases (machine side and fixture side) should follow these guidelines:

- It is highly suggested to not overcome a length of 30cm to reach the target using twisted pair cables.
- The twisted GNDs-data cable coming out from the programmer should reach the board GND plane and should have the same common GND reference.
- Keep the ISP lines separated from the rest of the cables that a production system would require for other purposes.

Using SMH tools and following these guidelines, it is possible to exploit the programming system at full potential without compromising protocol frequencies or data transfer speeds.

longer than 30cm using twisted pair cables.

D-U-N-S[®] 33-924-9717 T + 39 0434 421 111 F + 39 0434 639 021

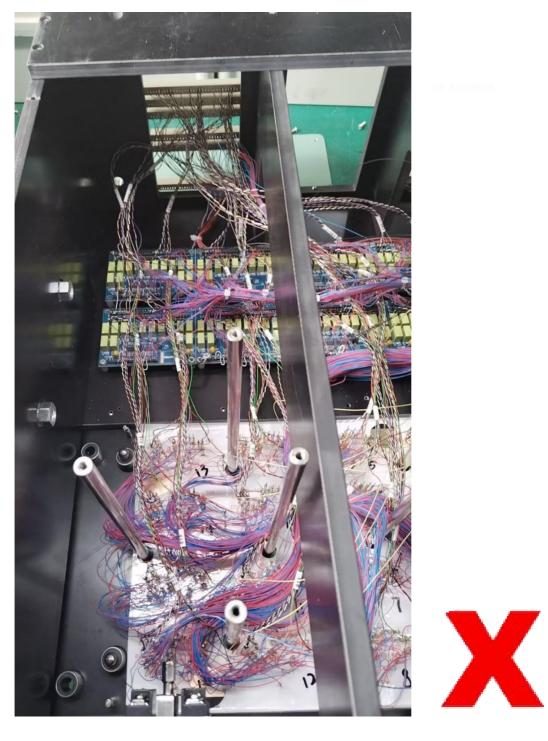

Here the programmer is well exploited thanks to the usage of flat cables no longer than 50cm that are reaching cable interface headers. Then ISP signals are made through wire-wrap technique no

SMH Technologies[®]

In the second image wire wrap technique 150cm long is used outside the fixture for ISP signals. The same ISP signals are mixed together with other cables whose purposes are aside the programming. This environment is extremely limiting the programmer potential and absolutely not assuring signal integrity and stability.
