We want your feedback!

SMH Technologies is always on the look-out for new ways to improve its Products and Services. For this reason feedback, comments, suggestions or criticisms, however small, are always welcome.

Our policy at SMH Technologies is to comply with all applicable worldwide safety and EMC/EMI regulations.

This product is certified to comply with the 2004/108/CE Directives and is in conformity with the EN55024/A1 the EN55024/A2 and the EN6100-6-2 standards.

In a domestic environment, this product may cause radio interference in which case the user may be required to take adequate prevention measures.

Attaching additional wiring to this product or modifying the product operation from the factory default as shipped may effect its performance and cause interference with other apparatus in the immediate vicinity. If such interference is detected, suitable mitigating measures should be taken.

Disposal of Waste Electrical & Electronic Equipment (WEEE).

In the European Union, this label indicates that this product should not be disposed of with household waste. It must be deposited in an appropriate facility to allow for recovery and recycling. For more detailed information about the recycling of this product, please contact your local city office, household waste disposal service or the retail store where you purchased this product.

0 Before Starting

Note: the FlashRunner System Software CD-ROM and/or SMH Technologies website (www.smh-tech.com) may contain an updated version of this user's manual. Please check before continuing reading this documentation.

0.1 Important Notice to Users

While every effort has been made to ensure the accuracy of all information in this document, SMH Technologies assumes no liability to any party for any loss or damage caused by errors or omissions or by statements of any kind in this document, its updates, supplements, or special editions, whether such errors are omissions or statements resulting from negligence, accidents, or any other cause.

0.2 Safety

FlashRunner is a low-voltage device. However, when integrating it inside an automatic test equipment or when interfacing it with other systems, take all precautions in order to avoid electrical shocks due to, for example, different ground references.

Make all connections to the target system before applying power to the instrument.

To protect FlashRunner against electrostatic discharge (ESD), always connect yourself to ground (e.g. via wrist straps) when handling the instrument.

Always store FlashRunner inside an antistatic bag when not in use.

0.3 Getting Technical Support

SMH Technologies is continuously working to improve FlashRunner firmware and to release programming algorithms for new devices. SMH Technologies offers a fast and knowledgeable technical support to all of its customers and is always available to solve specific problems or meet specific needs.

To get in touch with SMH Technologies, please refer to the contact information below.

0.4 Additional Documentation

This user's manual provides information about how to setup FlashRunner Quattro and its hardware characteristics.

For information about FlashRunner commands and their syntax, including specific commands for specific family of microcontrollers, please refer to the FlashRunner Programmer's Manual, included (in PDF format) in the FlashRunner CD-ROM.

1 Overview

1.1 What is FlashRunner Quattro?

FlashRunner Quattro is a high-integration in-system gang programmer, based on the FlashRunner patented technology. FlashRunner Quattro is designed for programming multi-PCB panel assemblies, and is based on the FlashRunner technology. This means:

- Extremely fast programming (it is one of the fastest in-system programming system on the market);
- Standalone operations (projects and code images stored on memory cards);
- Compact and robust design for production environments.

Figure 1.1: FlashRunner Quattro

FlashRunner Quattro is composed of a mainboard which hosts the programming and demultiplexing modules, plus various connectors used to interface to the target system and host/ATE. FlashRunner Quattro is available in three different models, to best suit different gang programming needs:

- FR04A04: 4 ISP channels system (4 true parallel channels), no ISP channel demultiplexing;
- **FR04A08:** 8 ISP channels system (4 parallel channels, each demultiplexable to 2 channels, with galvanic isolation);
- **FR04A16:** 16 ISP channels system (4 parallel channels, each demultiplexable to 4 channels).

In all of the above configurations, each of the ISP channels is composed of:

- Six digital, bidirectional lines;
- Two analog/digital lines (analog out, digital in/out);
- Two power lines;
- One ground line (common for all channels).

1.1.1 General features

- Fastest programming algorithms (as fast as target device's memory technology limit), approved by silicon manufacturers;
- Easy ATE integration;
- Standalone operations (projects and code images stored on memory cards);
- Controllable by ATE through optoisolated LAN, RS-232 or parallel control lines;
- Supports most ISP protocols (BDM, JTAG, SPI, I2C, MON, ICC, SCI, etc.);
- Flexible, fully configurable;
- Compact and robust design for production environments;
- Data integrity guaranteed (every data transfer to/from the host system or Secure Digital card is CRC tagged).

1.1.2 Hardware features

- 9 to 18V power supply input;
- ISP lines:
 - Six digital I/O lines;
 - Two digital I/O or analog output lines;
 - Two programmable output voltages;
 - One programmable clock output
- Secure Digital memory cards (up to 2 GB);
- 512 bytes on-board dynamic memory;
- On-board timekeeper and calendar for time-stamped log file;
- One optoisolated command inputs (START);
- Three optoisolated status outputs (FAIL, PASS, BUSY);
- Five project selection lines (SEL[4..0]);
- Optoisolated RS-232/Ethernet channels.

1.1.3 Software features

- Fully autonomous standalone mode thanks to its SD memory cards (FAT16);
- Controllable by any host system through a terminal utility and simple ASCII protocol;
- Up to 32 hardware-selectable projects (scripts), unlimited softwareselectable projects;
- Interface Library DLL to control the instrument from within user written applications;
- Optional Data Protection System to make the contents of the binary file to be programmed to the target device not readable (and not duplicable) by non-authorized people;
- Log files;
- Erase, blank check, program, read, verify, oscillator trimming, etc.

1.2 Package Checklist

The FlashRunner Quattro package includes the following items:

- FlashRunner Quattro unit, including SD cards already pre-installed with the programming algorithm(s) you specified at the time of purchase;
- An Ethernet cross cable;
- A RS-232 cable;
- FlashRunner "System Software" CD-ROM, containing the FlashRunner Control Panel utility and the FlashRunner Programmer's Manual in PDF format;
- This user's manual;
- A registration card.

1.3 Hardware Overview

FlashRunner Quattro is composed of four, independent programming modules (each one with its one SD card) and four multiplexing modules (each one dedicated to the relative programming modules).

1.3.1 Power Supply

FlashRunner Quattro is powered through a 9-18V DC terminal block connector.

1.3.2 LAN Connector

The LAN connector is used for communication with the host PC system. Use the provided Ethernet cross cable to connect FlashRunner with your PC.

1.3.3 LAN Reset Push-Button

The "LAN RESET" resets the instruments' IP address to its factory programmed value.

1.3.4 RS-232 Connector

Alternatively, communication with the host PC can be done with the RS-232 connector. Use the provided serial cable to connect FlashRunner with your PC.

1.3.5 Control Connector

The "CONTROL" DIN connector groups the parallel control lines that an ATE system can use to control FlashRunner, instead of communicating with the instrument through the serial or Ethernet port.

1.3.6 ISP Connectors

The "ISP GROUP A" and "ISP GROUP B" DIN connectors group the input lines from the ATE system and the ISP output lines from FlashRunner.

1.4 Programming Algorithms and Licenses

FlashRunner Quattro includes programming algorithms for several devices. In order to program a specific device, however, a specific license file for that device must be purchased.

Note: FlashRunner Quattro comes already preinstalled with the license(s) you specified at the moment of purchase. You can purchase additional licenses at any future moment.

Programming algorithms and license files are stored in the SD card (see the FlashRunner Programmer's Manual for more information).

1.4.1 Installing New Licenses

When you buy an additional license for a specific device, you will get:

- An algorithm file (.alg);
- A license file (.lic);
- A device-specific script example (.frs).

The .alg file contains the actual programming algorithm for the requested device (and several other devices of the same family).

The .lic file contains an unlocking code that will let you use the programming algorithm. A license file enables the use of a specific programming algorithm on a specific FlashRunner instrument (licenses are serial number specific).

The script file contains an example of script to use as a starting point for your specific programming needs (for more information on scripts, see the FlashRunner Programmer's Manual).

To install the new license, do the following (for each programming module):

- 1. Copy the .alg file into the **\ALGOS** directory of the SD card (if an .alg file with the same name already exists, overwrite it);
- 2. Copy the .lic file into the \LICENSES directory of the SD card.

To copy files on the SD card, use either a standard card reader connected to a PC or transfer the files using the FlashRunner **FSSENDFILE** command (for more information on FlashRunner commands, see the FlashRunner Programmer's Manual).

Alternatively, you can use the FlashRunner Control Panel utility to install new programming algorithms and licenses. For more information on the FlashRunner Control Panel please refer to the FlashRunner Programmer's Manual.

1.5 Upgrading the Firmware

The FlashRunner firmware can be easily upgraded using the provided Control Panel utility. For more information, please refer to the FlashRunner Programmer's Manual.

2 System Setup

2.1 Overview

Note: the example shows how to set up the system for programming a Freescale MC68HC908QY4 microcontroller. For how to connect to other target devices, please refer to the FlashRunner Programmer's Manual.

This chapter will explain how to set up FlashRunner Quattro for the first time. Although FlashRunner is typically used for standalone operations (Standalone mode), the examples in this chapter will use the host system to send commands to FlashRunner (Host mode).

When moving FlashRunner to the production environment, you can take full advantage of the instrument's SD cards to make the instrument work without being controlled by the host system.

For more information about Standalone mode and Host mode, see the FlashRunner Programmer's Manual.

2.2 Software Setup

The FlashRunner system software setup installs all of the required components to your hard drive. These components include:

- The FlashRunner Control Panel utility;
- Script examples;
- Documentation in PDF format.

To install the FlashRunner system software:

- Insert the "System Software" CD-ROM into your computer's CD-ROM drive;
- A startup window will automatically appear. Choose "Install Instrument Software" from the main menu. Follow the on-screen instructions.

Note: to install the FlashRunner system software on Windows 2000 or Windows XP, you must log in as Administrator.

2.3 Hardware Setup

To set up FlashRunner Quattro, you must follow the steps below, in the indicated order:

- 1. Interface FlashRunner with your test/programming equipment;
- 2. Connect FlashRunner to the host PC system;
- 3. Power up FlashRunner;
- 4. Set up LAN settings (if you use the Ethernet connection);
- 5. Send FlashRunner commands via the FlashRunner Control Panel utility.

2.3.1 Interfacing FlashRunner with your Test/Programming Equipment

Build one or more ISP cables to connect from the FlashRunner's "ISP GROUP" connectors to your target board(s). Make all the required connections (power, oscillator, ISP signals) to the target microcontrollers.

Typical connections for all the device families supported by FlashRunner are shown in the FlashRunner Programmer's Manual.

2.3.2 Connecting FlashRunner to the Host PC System

You can connect FlashRunner to the host system through either the RS-232 or LAN port. Both the serial and LAN connectors are located in the Connection layer.

FlashRunner Quattro comes with a serial cable and an Ethernet cross cable to connect directly to a host PC.

2.3.3 Powering Up FlashRunner

Power up FlashRunner by connecting the output of a power supply to the terminal block connector located in the Connection layer. FlashRunner accepts any DC voltage between 9V and 18V.

Note: In order to maintain the system stability it is strongly recommended not to cycle FlashRunner power off and on after each script execution.

2.3.4 Setting Up LAN Settings

If you connected FlashRunner to the host PC using the Ethernet connection, you need to set up the FlashRunner IP address. For learning how to set up the FlashRunner IP address, please refer to the FlashRunner Programmer's Manual.

- Launch the FlashRunner Control Panel utility. Select Start > Programs > SMH Technologies > FlashRunner > Control Panel. The Control Panel utility will open.
- 2. To establish a connection with FlashRunner, on the "**Communication Settings**" section, select:
 - "FlashRunner serial version" (if you are connected to FlashRunner through a serial port), or
 - "FlashRunner LAN version" (if you are connected to FlashRunner through an Ethernet port).

Next, specify:

- The COM port you are using and the baud rate (for the serial connection—by default, FlashRunner communicates at 115200 bps), or
- The instrument IP address (for the Ethernet connection). For learning how to set up the FlashRunner IP address, please refer to the FlashRunner Programmer's Manual.

Figure 2.1: FlashRunner Control Panel, Communication Settings

- 3. Click the **"Connect"** button. On the **"Communication History"** section, note the commands that have been sent and received. In this case, the **MCSPING** command is automatically sent to FlashRunner, which replies with the **PONG>** string.
- 4. In the edit box below the communication history, type the following command (followed by Return):

MCSETENG ENG1

This commands instructs the instrument to send all subsequent commands to the first programming module.

5. Send the following additional commands:

TCSETDEV FREESCALE MC68HC908QY4 HC08 TCSETPAR FOSC 16000000

TCSETPAR FDIV 4 TCSETPAR VDD 5000

These commands set, respectively, the target microcontroller, the oscillator frequency, the internal divisor and the VDD voltage. In this example, we used a 16 MHz oscillator, the internal divisor for MC68HC908QY4 devices is fixed to 4, and the VDD is 5V. FlashRunner will respond to each command with the > string, indicating that the command has been successfully executed. After sending these commands, the Control Panel will look like the figure below.

	dalone In-System Programmer	Create FlashRunner Binary Format (.FRB)

TCSETPAR FDIV 4 > TCSETPAR VDD 5000 >		H

Figure 2.2: FlashRunner Control Panel, Target Device Configured

6. When working with Freescale HC08 devices, FlashRunner requires you to specify the power up and power down times, in milliseconds. Send the following two commands:

TCSETPAR PWDOWN 10 TCSETPAR PWUP 10

7. After specifying the target device settings, we are ready to transfer to FlashRunner the binary image to be programmed into the target device. FlashRunner accepts only image files in a .frb (FlashRunner Binary) format. To convert your binary, Intel-Hex or S19 image file to the FlashRunner format, click the **"Create FlashRunner Binary Format"** button. The following dialog box will appear.

	ner Binary Format	
Input		
Filename:		
Format:		Cancel
Offset:	00000000	
	eated in the local \BINARIES folder)	
Filename:	.frb	
	fifb	
Filename:	.frb	
Filename:	Fifb C Don't Care C 00h	

Figure 2.3: FlashRunner Control Panel, Binary File Conversion

In the "**Input**" section, specify the source file to be converted, its format, and the address from which the file conversion will start (offset). In the "**Output**" section, specify the output filename and the value used to fill unused locations.

Click the **"OK"** button. The FlashRunner Binary file will be created in the local **\BINARIES** folder.

8. To transfer the created image to selected programming module, send the following command:

FSSENDFILE YMODEM DEMO.FRB

In this example, the image file is called **DEMO.FRB**. The following dialog box will appear.

Sending				
File:				Start
Protocol:	Ymodem 💌	Bytes sent:		Exit
Transfer pro	ogress			

Figure 2.4: FlashRunner Control Panel, File Transfer

Click the "..." button to browse for the image file to be send, then click "**Start**" to begin the transfer. The file will be saved to the SD card of the selected programming module, in the **\BINARIES** folder.

9. (Only for FR04A08 and FR04A16) Next, we have to specify which of available ISP sites (for the selected programming module, in this case the first one) FlashRunner will use as output. To do this, send the following command:

MXCLOSE 1

This will select the first ISP site, routing all of the FlashRunner's ISP lines of the first programming module to the target board through this site.

10. We are now ready to start the actual programming part. Send the following commands:

```
TPSETSRC FILE DEMO.FRB
TPSTART
TPCMD SETPWD CONST $FF $FF $FF $FF $FF $FF $FF
TPCMD MASSERASE F
TPCMD BLANKCHECK F $EE00 4608
TPCMD PROGRAM F $EE00 $EE00 4608
TPCMD VERIFY F S $EE00 $EE00 4608
TPEND
```

The data to be programmed is taken from the image file starting at \$EE00 (offset from the beginning of the file), is programmed to the target microcontroller starting from the location \$EE00 and is 4608 bytes long.

The **TPSETSRC** command specifies the source file for the **TPCMD PROGRAM** e **TPCMD VERIFY** commands that come next. All the actual programming operations are sent between a **TPSTART** and **TPEND** command. The **TPCMD SETPWD** command sets the security bytes needed to perform subsequent operations.

After sending these commands, the Control Panel will look like the figure below.

	ARUNNER andalone In-System Programmer	Create FlashRunner Binary Format (.FRB)
Communication Settings-		Send FlashRunner <u>B</u> inaries

	13200	Send Licenses
Restore Defaults	Connect	<u>G</u> et Log
Update Firmware	Disconnect	Eormat SD Card
Communication History		
>		Cigar
T P END		

11. We are now done with programming the target device. Click the "Disconnect" button to free the serial port resource. For detailed information on all of the FlashRunner commands and their syntax, including specific commands for specific family of microcontrollers, please refer to the FlashRunner Programmer's Manual, included (in PDF format) in the FlashRunner CD-ROM.

Programming can be automated by creating "scripts". Scripts are text files, stored in the SD cards, which contain a sequence of FlashRunner commands. See the FlashRunner Programmer's Manual for more information about scripts.

3 Connectors

3.1 Overview

FlashRunner Quattro connects to your programming/testing system through three connectors: two connectors ("ISP GROUP A" and "ISP GROUP B") group the outputs from FlashRunner; the other connector ("CONTROL") groups control signals.

Additionally, an RS-232 and Ethernet connector are provided for full interfacing with the ATE system.

3.2 ISP Connectors

The "ISP GROUP A" and "ISP GROUP B" connectors group the signals needed to program up to 16 target devices (depending on the FlashRunner Quattro model). These connectors have several input/output lines, both digital and analog, that are automatically configured by FlashRunner depending on the specific target device to be programmed (see the FlashRunner Programmer's Manual to learn how to connect these lines to your specific target device).

Note: *ISP* and *I/O* signals are not optoisolated and are referenced to GND (the power supply ground).

Additionally, in order to avoid undesired current loops between the FlashRunner power supply and the target board, a power supply with a floating output (ground not referenced to the earth potential) should be used.

3.3 Control Connector

The "CONTROL" D-Sub connector is used to communicate with the host system and for integration with automatic programming/testing equipment.

Note: all control signals are referenced to GND_I, separate from GND.

This allows a host system to safely communicate with FlashRunner Quattro even when the target board has a different ground reference than the host system's (and it's not possible to connect them together).

Additionally, in order to avoid undesired current loops between the FlashRunner power supply and the target board, a power supply with a floating output (ground not referenced to the earth potential) should be used.

Figure 3.2: Control Connector

Table 3.6: Control Connector	Signals
------------------------------	---------

Pin #	Signal Name	Description
A1	SEL0	Script selection 0 (input, referenced to GND_I)
A2	SEL1	Script selection 1 (input, referenced to GND_I)
A3	SEL2	Script selection 2 (input, referenced to GND_I)
A4	SEL3	Script selection 3 (input, referenced to GND_I)
A5	SEL4	Script selection 4 (input, referenced to GND_I)
A6	SG0	ISP site selection 0 (input, referenced to GND_I)
A7	SG1	ISP site selection 1 (input, referenced to GND_I)
A8	5V_I_FUSE	5V output (output, fuse-protected, referenced to GND_I)
A9	GND_I	Ground

Pin #	Signal Name	Description
A10	GND_I	Ground
A11	GND_I	Ground
A12	GND_I	Ground
A13	GND_I	Ground
A14	GND_I	Ground
A15	GND_I	Ground
A16	GND_I	Ground
B1	START1	Programming module 1 START (input, referenced to GND_I, active low)
B2	BUSY1	Programming module 1 BUSY (output, referenced to GND_I, active low)
B3	PASS1	Programming module 1 PASS (output , referenced to GND_I, active low)
B4	FAIL1	Programming module 1 FAIL (output , referenced to GND_I, active low)
B5	5V_I_FUSE	5V output (output, fuse-protected, referenced to GND_I)
B6	GND_I	Ground
B7	GND_I	Ground
B8	GND_I	Ground
B9	GND_I	Ground
B10	GND_I	Ground
B11	GND_I	Ground
B12	START2	Programming module 2 START (input , referenced to GND_I, active low)
B13	BUSY2	Programming module 2 BUSY (output, referenced to GND_I, active low)
B14	PASS2	Programming module 2 PASS (output , referenced to GND_I, active low)
B15	FAIL2	Programming module 2 FAIL (output , referenced to GND_I, active low)
B16	5V_I_FUSE	5V output (output, fuse-protected, referenced to GND_I)
C1	START3	Programming module 3 START (input , referenced to GND_I, active low)
C2	BUSY3	Programming module 3 BUSY (output, referenced to GND_I, active low)
C3	PASS3	Programming module 3 PASS (output , referenced to GND_I, active low)
C4	FAIL3	Programming module 3 FAIL (output , referenced to GND_I, active low)
C5	5V_I_FUSE	5V output (output, fuse-protected, referenced to GND_I)
C6	GND_I	Ground
C7	GND_I	Ground
C8	GND_I	Ground
C9	GND_I	Ground
C10	GND_I	Ground
C11	GND_I	Ground
C12	START4	Programming module 4 START (input , referenced to GND_I, active low)
C13	BUSY4	Programming module 4 BUSY (output, referenced to GND_I, active low)
C14	PASS4	Programming module 4 PASS (output , referenced to GND_I, active low)
C15	FAIL4	Programming module 4 FAIL (output, referenced to GND_I, active low)
C16	5V_I_FUSE	5V output (output, fuse-protected, referenced to GND_I)

3.4 Control Connector usage Example

For example, for programming using Control Connector following steps has to be performed:

- Use A1, A2, A3, A4, A5 to select the desired script (there are 5 signal coded so as to correspond to maximum 32 scripts, from 0 to 31). (The selected script must be present on the SD Card and the corresponding name has to be in the form SCRIPT0.frs, SCRIPT1.frs ... SCRIPT31).
- Use A6, A7 to select the channel (site) to be used for each engine. (There are 2 selection lines, this meaning 4 sites. There are 4 sites per each engine. This means 16 programming sites in total for FR04A16).
- 3. Use B1 (corresponding to signal START1) to start the programming on module 1 (it means that the engine 1 will be active).

Use B12 (corresponding to signal START2) to start the programming on module 2 (it means that the engine 2 will be active).

Use C1 (corresponding to signal START3) to start the programming on module 3 (it means that the engine 3 will be active).

Use C12 (corresponding to signal START4) to start the programming on module 4 (that means the engine 4 will be active).

All the signals described above at point 3 are INPUT. The associated signal B2, B3, B4 - B13, B14, B15 - C2, C3, C4 - C13, C14, C15 are OUTPUT corresponding to BUSY, PASS, FAIL signals for each module.

If all the 4 sites (channel) of engine1 are used and the PASS LED associated to engine1 light is on, it means that the programming on all the 4 sites has been completed successfully. If the FAIL LED associated to engine1 light is on, it means that the programming on one (or more) sites associated to that specific engine has failed. There is no other way to know which is the site (or sites) that failed but to check all the 4 sites associated to that engine.

The above considerations are applicable also to engine2, angine3 and engine4.

3.5 RS-232 Connector

The "RS-232" D-Sub connector can be used to communicate with the ATE system.

Note: RS-232 signals are referenced to GND_I, separate from GND.

Figure 3.3: RS-232 Connector

Table 3.7: RS-232 Connector S	Signals
-------------------------------	---------

Pin #	Signal Name	Description
1	NC	Not connected
2	TX_RS232	TX (output, referenced to GND_I, RS-232 levels)
3	RX_RS232	RX (input, referenced to GND_I, RS-232 levels)
4	NC	Not connected
5	GND_I	Ground
6	NC	Not connected
7	NC	Not connected
8	NC	Not connected
9	NC	Not connected

4 Technical Specifications

4.1 Absolute Maximum Ratings

Table 4.1: Absolute Maximum Ratings

Parameter	Value
"POWER" Connector	
Maximum supply voltage on line POWER (reference GND)	-20V to +20V
"CONTROL" Connector	
Maximum input voltage on lines START, SEL[40], SG[10]	-2V to +20V
Maximum current on lines BUSY, PASS, FAIL	±10mA
"ISP GROUP" Connectors	
Maximum input voltage on lines DIO/AO[10], DIO[62], CLKOUT	-1V to +7V
Maximum current on lines DIO/AO[10], DIO[62], CLKOUT	±50mA
Maximum current on line VPROG0	500mA
Maximum current on line VPROG1	250mA
"RS-232" Connector	
Maximum input voltage on line RX_RS232	-25V to +25V
Maximum current on line TX_RS232	±60mA

4.2 DC Characteristics and Functional Operating Range

Table 4.2: DC Characteristics and Functional Operating Range	е
--	---

P	Condition		Value		
Parameter		Min	Тур	Max	
"CONTROL" Connector					
V _{IL} (input low voltage) on lines START, SEL[40]		0V	-	0.8V	
VIH (input high voltage) on lines START, SEL[40]		2.4V	-	15V	
V _{OL} (output low voltage) on lines BUSY, FAIL, PASS	$I_{OL} = 4mA$	-	-	0.8V	

Deservation	Ormalitien	Value		
Parameter	Condition	Min	Тур	Max
V_{OH} (output high voltage) on lines BUSY, FAIL, PASS		4.5V	-	5V
"RS-232" Connector				
VIL (input low voltage) on line RX_RS232		-	-	1.2V
VIH (input high voltage) on line RX_RS232		2.4V	-	-
V _{OL} (output low voltage) on line TX_RS232	$R_{LOAD} = 3K\Omega$	-	-	-5V
